Abstract

short explanation

Keywords: Multiple scattering, fresh fish

1   Single scatterer

We will be following a similar notation as used in A T-Matrix Reduced Order Model Software [2, 1].

Any incident and scattered wave in 2D, centred at the same polar coordinate axis, can be written as

$$\psi^{\text{inc}} = \sum_{n=-\infty}^{\infty} f_n J_n(kr) \mathrm{e}^{\mathrm{i}n\theta}, \tag{1}$$

$$\psi^{\text{s}} = \sum_{n=-\infty}^{\infty} a_n H_n(kr) \mathrm{e}^{\mathrm{i}n\theta}. \tag{2}$$

The T-matrix is an infinite matrix such that

$$a_n = \sum_{m=-\infty}^{\infty} T_{nm} f_m. \tag{3}$$

Such a matrix T exists when scattering is a linear (elastic scattering).

For instance, if ρ and c are the background density and wavespeed, then for a circular scatterer with density ρ_j, soundspeed c_j and radius a_j, we have that

$$T_{nm} = -\delta_{nm} Z_j^m, \ \ \text{with} \ \ Z_j^m = \frac{q_j J_m'(ka_j) J_m(k_j a_j) - J_m(ka_j) J_m'(k_j a_j)}{q_j H_m'(ka_j) J_m(k_j a_j) - H_m(ka_j) J_m'(k_j a_j)}, \tag{4}$$

where $q_j = (\rho_j c_j)/(\rho c)$ and $k_j = \omega/c_j$.
1.1 Single circular capsule

$$\psi^0 = \sum_{n=-\infty}^{\infty} f_n^0 J_n(k_0 r) e^{in\theta}, \tag{5}$$

$$\psi^1 = \sum_{n=-\infty}^{\infty} \left[f_n^1 J_n(k_1 r) + a_n^1 H_n(k_1 r) \right] e^{in\theta}. \tag{6}$$

Applying the boundary conditions,

$$\psi^0 = \psi^1 \quad \text{and} \quad \frac{1}{\rho_0} \frac{\partial \psi^0}{\partial r} = \frac{1}{\rho_1} \frac{\partial \psi^1}{\partial r}, \quad \text{on } r = r_0, \tag{7}$$

$$\psi^1 = \psi^{\text{s}} + \psi^{\text{inc}} \quad \text{and} \quad \frac{1}{\rho_1} \frac{\partial \psi^1}{\partial r} = \frac{1}{\rho} \frac{\partial (\psi^{\text{s}} + \psi^{\text{inc}})}{\partial r}, \quad \text{on } r = r_1. \tag{8}$$

Solving these boundary conditions (see capsule-boundary-conditions.nb) leads to

$$
\begin{aligned}
T_{nn} = &-\frac{J_n(ka_1)}{H_n(ka_1)} - \frac{Y_{\prime}^n(ka_1, ka_1)}{H_n(ka_1)} \left[Y^n(k_1 a_1, k_1 a_0) J_n'(k_0 a_0) - q_0 J_n(k_0 a_0) Y_{\prime}^n(k_1 a_1, k_1 a_0) \right] \\
&\times \left[J_n'(k_0 a_0)(q H_n(ka_1) Y_{\prime}^n(k_1 a_0, k_1 a_1) + H_n'(ka_1) Y^n(k_1 a_1, k_1 a_0)) \right. \\
&\left. + q_0 J_n(k_0 a_0)(q H_n(ka_1) Y_{\prime\prime}^n(k_1 a_1, k_1 a_0) - H_n'(ka_1) Y_{\prime}^n(k_1 a_1, k_1 a_0)) \right]^{-1}. \tag{9}
\end{aligned}
$$

where $q = \rho c/(\rho_1 c_1)$, $q_0 = \rho_0 c_0/(\rho_1 c_1)$, and

$$Y^n(x, y) = H_n(x) J_n(y) - H_n(y) J_n(x), \tag{10}$$
$$Y_{\prime}^n(x, y) = H_n(x) J_n'(y) - H_n'(y) J_n(x), \tag{11}$$
$$Y_{\prime\prime}^n(x, y) = H_n'(x) J_n'(y) - H_n'(y) J_n'(x). \tag{12}$$

2

2 Multiple scattering

Graf's addition theorem

$$H_n(kR_\ell)\mathrm{e}^{\mathrm{i}n\Theta_\ell} = \sum_{m=-\infty}^{\infty} H_{n-m}(kR_{\ell j})\mathrm{e}^{\mathrm{i}(n-m)\Theta_{\ell j}} J_m(kR_j)\mathrm{e}^{\mathrm{i}m\Theta_j}, \quad \text{for} \ \ R_j < R_{\ell j},$$

(13)

where we can also swap H_n and H_{n-m} for J_n and J_{n-m}.

Particle-j scatters a field

$$\psi_j = \sum_{m=-\infty}^{\infty} A_j^m H_m(kR_j)\mathrm{e}^{\mathrm{i}m\Theta_j}, \quad \text{for} \ \ R_j > a_j,$$

(14)

where (R_j, Θ_j) are the polar coordinates of $\boldsymbol{x} - \boldsymbol{x}_j$, where $\boldsymbol{x}_j$ is the centre of particle j.

Let the incident wave, with coordinate system centred at $\boldsymbol{x}_j$, be

$$\psi_{\mathrm{inc}} = \sum_{m=-\infty}^{\infty} f_j^m J_m(kR_j)\mathrm{e}^{\mathrm{i}m\Theta_j},$$

(15)

then the wave exciting particle-j is

$$\psi_j^E = \sum_{m=-\infty}^{\infty} F_j^m J_m(kR_j)\mathrm{e}^{\mathrm{i}m\Theta_j},$$

(16)

where

$$F_j^m = f_j^m + \sum_{\ell \neq j} \sum_{p=-\infty}^{\infty} A_\ell^p H_{p-m}(kR_{\ell j})\mathrm{e}^{\mathrm{i}(p-m)\Theta_{\ell j}}.$$

(17)

Using the T-matrix of particle-j we reach $A_j^n = \sum_m T_j^{nm} F_j^m$, which leads to

$$A_j^n = \sum_{m=-\infty}^{\infty} T_j^{nm} f_j^m + \sum_{\ell \neq j} \sum_{m,p=-\infty}^{\infty} A_\ell^p T_j^{nm} H_{p-m}(kR_{\ell j})\mathrm{e}^{\mathrm{i}(p-m)\Theta_{\ell j}}.$$

(18)

As a check, if we use (4) and swap $A_j^n \to A_j^n Z_j^n$, then we arrive at equation (2.11) in [3].

For easy implementation we need the functions:

$$\psi_{\mathrm{inc}} \mapsto f_j^m \quad \text{and} \quad \text{particle} \mapsto T_j^{nm}.$$

For efficient implementation we need to rewrite (18) as a matrix equation. Let

$$(\boldsymbol{A}_j)_n = A_j^n, \quad (\boldsymbol{f}_j)_n = f_j^n, \tag{19}$$

$$(\boldsymbol{T}_j)_{nm} = T_j^{nm}, \quad (\boldsymbol{\Psi}_{j\ell})_{mp} = H_{p-m}(kR_{\ell j})\mathrm{e}^{\mathrm{i}(p-m)\Theta_{\ell j}}, \tag{20}$$

and note that $\Theta_{\ell j} = \Theta_{j\ell} + \pi$. Then

$$\sum_{\ell \neq j}(\delta_{\ell j} - (1 - \delta_{\ell j})\boldsymbol{T}_j\boldsymbol{\Psi}_{j\ell})\boldsymbol{A}_\ell = \boldsymbol{T}_j\boldsymbol{f}_j, \tag{21}$$

which leads to one massive square matrix

$$\sum_{\ell \neq j}(\delta_{\ell j} - (1 - \delta_{\ell j})\boldsymbol{T}_j\boldsymbol{\Psi}_{j\ell})\boldsymbol{A}_\ell = \boldsymbol{T}_j\boldsymbol{f}_j, \tag{22}$$
